

ACT I — THE PROBLEM

URBAN CYCLING SAFETY REPORT

2026 EDITION

Maps optimize for safety

Not for your speed.

Google Maps and most navigation apps route cyclists onto the fastest road — not the safest one. That means busy highways, unprotected intersections, and neighborhoods with no bike infrastructure.

1,166

bicyclist deaths in 2023 — the highest ever recorded

Source: NHTSA Traffic Safety Facts, 2023

86%

increase in bicyclist deaths since 2010

Source: NHTSA FARS, 2010–2023

50,000

cyclists injured in traffic crashes in 2023 alone

Source: NHTSA / CRSS, 2023

PEDALCYCLIST FATALITIES · 2013–2023

65% of bicyclist deaths occur on arterial roads — which make up just 10% of the network. Non-motorist traffic deaths are up 51% since 2014.

ACT II — THE SOLUTION

ALLROUTE PRODUCT
V1

A navigation app that routes *for safety, not just speed.*

01

Safety-first routing

Reroutes cyclists around highways, high-crash intersections, and neighborhoods with little to no bike infrastructure.

02

Danger Visualization

Highlight areas with high numbers of cyclist accidents to visualize and understand the large lack of bike safety infrastructure.

We're not building another maps app — we're layering crash data and bike-infrastructure data on top of routing that already exists, so cyclists get the safe route by default.

ACT III — THE STACK

UNDER THE HOOD

BUILD NOTES

Built lean,
shipped in twelve hours.

TS

TypeScript

Type-safe application logic powering the risk-scoring model and the route-comparison engine.

Next

Next.js

Enables server-side rendering, static site generation, and easy file-based routing for modern web apps

CSS

CSS

The dark, editorial design system — typography, layout, and the report-style visual language you see here.

Landing page and product UI prototyped in Figma Make. Fully client-side — no backend required for this build.
